

Security

How Safe Are Your Systems?

A question that every business should be asking itself. In light of recent media attention to personal data theft and data protection policies, can you afford to not know?

The Right People for the Job

You wouldn't have a boat maker perform open heart surgery on you, so why would you retain a security consulting company that does not ask the right questions of you and your business?

Critical questions that should be asked:

- » What is the nature of your business?
- » What is the nature of your data?
- » Are there any legal issues that require confidentiality?
- » What is your company's systems management philosophy?

It's Who You Know

Many companies operate under the misconception that a network firewall protects them from all possible intrusions. The reality is that even the most expensive, sophisticated firewalls and other security devices will not protect your network if the intruder has knowledge of a legitimate user

account name and password. Once in your network with those credentials, the intruder can access everything that the legitimate user has privileges for, without doing one bit of "hacking."

Cypress Systems, Inc. will work with a business and its staff to educate all users on "best practices" with regard to security policies. We will walk you through the most common types of security vulnerabilities and assist you in developing a security plan to safeguard the integrity of your company's information.

Best Fit For You And Your Company

There is no such thing as "one size fits all" when it comes to network security. Each company requires a unique blend of security levels and protection methodologies. Cypress Systems, Inc. will analyze to a client's specific needs in relation to their business goals and develop a comprehensive security strategy including:

- » Customized security measures tailored to fit your business needs
- » Multi-layered approach to security (hardware, software, user education)
- » Solutions explained in easy to understand terms and not "techno-talk"
- » Vulnerability testing and assessment (hardware & software)
- » Security policy development
- » Assist in HIPAA and Sarbanes-Oxley Act compliance

Your network is the backbone of your organization. Manage your risk and protect your business.
